

Increased safety and comfort using technology cultivated for valve springs.

## Transmission springs

Coiling

Special heat treatment

Our company produces various high strength springs for use in automatic transmissions, such as damper springs, return springs, and accumulator springs. Here, we have applied our company's technology cultivated through our development of valve springs to provide drivers with enhanced safety and comfortability. We have also succeeded in making spring heights more compact through precision shaped material processing of both solid copper wire and oval-shaped cross-sections, which in turn contribute to making transmissions more compact.

### Product features

- Processing of various high strength springs is possible
- Compact thanks to precision shaped material processing

### Product applications

Automatic transmissions
