

Beautiful printing from beautiful shafts.

Carriage guide shafts

Surface coating

Beautiful shafts with mirror-finished surfaces. However, these products are not for decoration. Carriage guide shafts are used to slide the ink heads of inkjet printers at high speeds. This processing is necessary to ensure low-friction and smooth operations. Also, beautiful printing will be hindered if there is any warpage or distortion. We use solid shafts and TUBE shafts that limit warpage for our paper-feed rollers. Because their movement is smooth with no distortion, high-definition images can be printed.

Product features

- Shafts with the same level of warping accuracy as paper-feed rollers
- Low friction can be achieved thanks to the mirror-finish
- Selection is possible from solid materials and TUBE materials

Product applications

Shafts for ink head slides used in inkjet printers
